

NOTES RELATING TO THE FLORA OF BHUTAN: XXXVI. *UMBELLIFERAE*, II

M. F. WATSON*

The second and final part, in which Himalayan taxa in the genera *Acronema*, *Angelica*, *Chamaesciadum*, *Chamaesium*, *Heracleum*, *Lalldhwojia*, *Oenanthe*, *Physospermopsis*, *Pimpinella*, *Pleurospermopsis*, *Pleurospermum*, *Schulzia*, *Selinum*, *Sinocarum*, *Tordyliopsis* and *Vicatia* are typified with notes on some critical groups (notably *Acronema*, *Selinum* and *Sinocarum*). The new name *Cnidium bhutanicum* is established. A list of voucher specimens for the whole Flora account is appended.

Keywords. *Acronema*, *Angelica*, *Apiaceae*, *Chamaesciadum*, *Chamaesium*, *Cnidium*, *Heracleum*, *Lalldhwojia*, *Oenanthe*, *Physospermopsis*, *Pimpinella*, *Pleurospermopsis*, *Pleurospermum*, *Schulzia*, *Selinum*, *Sinocarum*, *Tordyliopsis*, typification, *Vicatia*.

INTRODUCTION

This is the second paper of a two-part series presenting the taxonomic and nomenclatural decisions resulting from the study of E Himalayan *Umbelliferae* for the *Flora of Bhutan*. The first part (Watson, 1996) deals with the ten new species and two new combinations, and the current paper includes the numerous typifications and critical notes needed for the interpretation of the Flora account. During the course of the study the author has had the chance to examine a great deal of the herbarium material available from the E Himalaya (mainly housed at BM, E and K). In order to aid interpretation of past works, and help with identification of duplicate material housed in other herbaria, the author has appended a complete listing of the specimens identified for the whole Flora area (i.e. Bhutan, Chumbi Valley (Tibet), the Indian state of Sikkim and Darjeeling District of West Bengal).

Nathaniel Wallich's herbarium, assembled during the early part of the 19th century, includes many species of Himalayan *Umbelliferae*. He documented this herbarium in his Catalogue (Wallich & Bentham, *Numer. List* 1829–49) coining many new names. Duplicate sets of specimens were distributed, some bearing these Catalogue numbers, to many herbaria worldwide (top set at K-W, available on IDC microfiche). Unfortunately this list contains no descriptions and all the new names are invalidly published as *nomina nuda*. Wallich collated his herbarium putting different gatherings of what he thought were the same plant under the same species number, distinguishing separate collections as decimal divisions of this. Wallich had a huge task to collate his herbarium ready for splitting and distribution, and it is not surprising that he made mistakes and mixed collections. De Candolle received an unnumbered set of Wallich's herbarium (now housed at G-DC, also available on

* Royal Botanic Garden Edinburgh, 20A Inverleith Row, Edinburgh EH3 5LR, UK.

IDC microfiche) and validated many of Wallich's Umbel names in his *Prodromus* (1830), often under different generic names. The majority of De Candolle's names still require formal lectotypification, and given the problems of mixed Wallich collections I have critically dealt with his E Himalayan taxa in this paper. Unless otherwise stated I have used De Candolle's own herbarium as the primary source of lectotypes as this is what he would have used. Indeed, where only one specimen is now present in the De Candolle herbarium this could be considered the holotype. However, one cannot rule out any loss of material from this herbarium since the publication of *Prodromus*, and not all his specimens were included in the microfiche edition, so I am treating all new typifications as lectotypifications. I have not seen the collections at Geneva, but using the IDC microfiche of De Candolle's herbarium, in conjunction with the Wallich Herbarium at Kew, I have chosen the best specimen showing the salient characters (usually the one with most mature fruit). The specimens in other herbaria bearing the same Wallich numbers may be from different gatherings, but where the taxa and phenology of the specimens match the De Candolle material they are presumed isolectotypes.

Since De Candolle only a few people have worked on the whole family across the Himalayan range (Clarke, 1879; Mukherjee & Constance, 1993), and some genera have become taxonomically entangled by the dabblings of botanists looking at small geographic ranges, often using poor material. Although this paper leaves some E Himalayan umbellifer problems unresolved, I hope that it will provide a solid basis for future research. It is envisaged that through the revision processes of the Chinese *Umbelliferae* account for the new *Flora of China* (coordinated by the author), Chinese and Western umbellifer experts will be able to collaborate towards a better understanding of the complex Sino-Himalayan members.

Acronema Edgew.

The genus *Acronema* is critical and problematic, and has probably suffered the worst of all Himalayan umbellifer genera through the dabblings of botanists working on inadequate material, from small geographic areas (see also *Sinocarum* R.H. Shan & F.T. Pu). During the mid 1980s Farille worked on the Himalayan material from the major British herbaria (BM, E and K) leaving many annotations and coining new names, but did not formally publish them. He apparently used a narrow species concept and did not take into account the published Chinese taxa: many of his blunt-petaled, thick-rooted species should be referred to *Sinocarum*. For the *Flora of Bhutan* I have dealt with the Bhutanese and Sikkimese material in context with the whole geographic range of the genus, but a full monographic treatment of *Acronema* and its allied genera *Pimpinella* L., *Tongoloa* H. Wolff and *Sinocarum* is badly needed. Given the paucity of good herbarium material this is a challenging task and will require extensive field studies to elucidate the true generic boundaries. For the purposes of the *Flora of Bhutan* these genera are separated on the following suites of diagnostic characters:

Pimpinella: rootstock fusiform to a robust tap-root; leaf segments ovate to lanceolate, petioles narrowly winged at base; flowers regular, petals rounded to acute.

Acronema: rootstock usually a small, globose tuber; leaf segments lanceolate to linear-lanceolate, petioles narrowly sheathed; flowers regular, petals acute to finely acuminate.

Sinocarum: rootstock usually a stout elongate tuberous rhizome; leaf segments lanceolate to linear-lanceolate, petiole sheaths greatly expanded; flowers somewhat irregular, petals rounded to acute.

Tongoloa: rootstock a woody tap-root; leaf segments lanceolate to linear-lanceolate, petioles broadly sheathed at base; flowers weakly irregular, petals rounded.

Key to Bhutanese species of Acronema

- 1a. Rootstock a thick elongate rhizome or tap-root; umbels usually many-rayed, rays >8 ; umbellules many-flowered, pedicels, >9 , minutely puberulent; petals elliptic to obovate, apex acute _____ **A. bellum** (C.B. Clarke) P.K. Mukh.
- 1b. Rootstock a globose tuber or slender rhizome; umbels with fewer (<8) rays, and fewer pedicels (<8) both usually glabrous; petals ovate-acuminate to lanceolate with a filiform tip _____ 2
- 2a. Leaflets with margin, main and secondary veins conspicuously scaberulous above; petals ovate (>0.7 mm wide) with an acuminate tip; fruit subglobose _____ **A. nervosum** H. Wolff
- 2b. Leaflets glabrous or minutely scaberulous on margins and midrib only; petals lanceolate (<0.7 mm wide) tips acuminate to filiform; fruit narrowly ovoid or subglobose _____ 3
- 3a. Plants usually >25 cm tall; petals creamy white with long densely pubescent filiform tips $2-3 \times$ length of blade; mature fruits subglobose _____ **A. hookeri** (C.B. Clarke) H. Wolff
- 3b. Plants usually <25 cm tall; petals white to purplish, acute to acuminate, but tips $<2 \times$ blade and at most minutely papillate; fruits subglobose to narrowly ovoid _____ 4
- 4a. Plants usually <5 cm tall; petals linear-subulate; fruit subglobose _____ **A. sichuanense** S.L. Liou & R.H. Shan
- 4b. Plants >5 cm tall; petals lanceolate; fruit ovoid-globose to narrowly ovoid _____ 5
- 5a. Petals purplish with narrowly acuminate or shortly filiform minutely papillate tips; fruits narrowly ovoid _____ **A. tenerum** (Wall. ex DC.) Edgew
- 5b. Petals acute, glabrous; fruits ovoid-globose _____ **A. pseudotenerum** P.K. Mukh.

Acronema bellum (C.B. Clarke) P.K. Mukh. in Bull. Bot. Surv. India 24: 42 (1983).

Syn.: *Pimpinella bella* C.B. Clarke, Fl. Brit. India 2: 686 (1879). Type: Sikkim: Phulloot [Phalut], 11,000ft, 27 x 1875, C.B. Clarke 25,719 (lecto. selected here K.).

An unusual large, robust plant with stout rootstock and blunt petals that sits rather uncomfortably on the boundary between *Pimpinella* and *Acronema*. Further detailed study is needed to place this distinctive taxon firmly.

Acronema handelii H. Wolff, Pflanzenr. 90 Heft. (4.228): 322 (1927).

Syn.: *Pimpinella handelii* (H. Wolff) M. Hiroe, Umbelliferae of World 831 (1979). Type: China: *Acronema handelii* H. Wolff [det. H. Wolff], NW Yunnan, between Peti and Alo, to the SW of Chungtien, 3800–4000m, 8 viii 1914, H. Handel-Mazzetti 4588 (Diar. Nr. 732) (lecto. selected here E; isolecto. US).

The specimen indicated on the sheet as the type by Farille, is formally selected.

Although recorded in the literature as occurring in Bhutan, all specimens from the area have proved to be misidentifications.

Acronema hookeri (C.B. Clarke) H. Wolff, Pflanzenr. 90 Heft. (4.228): 323 (1927).

Syn.: *Pimpinella hookeri* C.B. Clarke, Fl. Brit. India 2: 686 (1879). *Carum hookeri* (C.B. Clarke) Franch. in Bull. Soc. Philom. Paris VIII. 6: 122 (1894). Type: Sikkim: *Acronema* sp. 2, Lachen, 11,000ft, 31 vii 1849, J.D. Hooker (lecto. selected here K).

In the original description Clarke cites the Hooker specimens of *Acronema* sp. 2 from 'Sikkim, Northern valleys, Samdong and Lachen, alt. 8–11,000 ft'. The two Hooker specimens bearing his original field labels from Lachen and Samdong, and with Clarke's handwritten determination, are both rather immature with no fruit. The Lachen specimen is chosen as it is the most advanced and shows the underground parts.

Literature records of *A. paniculatum* (Franch.) H. Wolff from Bhutan have proved to be based on misidentifications of *A. hookeri*.

Acronema hookeri (C.B. Clarke) H. Wolff var. **graminifolium** (W.W. Sm.) H. Wolff, Pflanzenr. 90 Heft. (4.228): 323 (1927).

Syn.: *Pimpinella hookeri* C.B. Clarke var. *graminifolium* W.W. Sm. in Rec. Bot. Surv. India 4: 267 (1913). *Acronema graminifolium* (W.W. Sm.) S.L. Liou & R.H. Shan in Acta Phytotax. Sin. 18(2): 197 (1980). Type: Chumbi Valley: Bhootan Himalaya, Punkabeesemoo, 26 vii 1884, Dungboo 247 (lecto. selected here K).

Several type elements were cited by Smith in his original description: Sikkim, Pankabeemoo, 26 vii 1884, Dungboo 247; Sikkim, Yakcha, Lachung Valley, 10,000ft, Smith and Cave; Sikkim, Zemu Valley, 9–10,000ft, Smith and Cave; Gammie and Kings Collector without definite locality. Mukherjee and Constance (1993: 125) implicitly selected the first, and here it is formally designated as the lectotype.

This narrow-leaved taxon has been reported by several botanists to grow intermixed with the typical form, and hence is treated only at the varietal rank.

Acronema nervosum H. Wolff in Repert. Spec. Nov. Regni. Veg. Beih. 27: 315 (1930).
Type: Sikkim: Changu [Tsomgo], 2000ft, 10 vii 1910, *W.W. Smith* 3361 (lecto. selected here K).

Wolff cited *W.W. Smith* 3361 as the type without herbarium locality, the specimen at K, bearing Wolff's determination, is hereby selected as the lectotype.

Acronema pseudotenerum P.K. Mukh., Actes du 2ème Symposium International sur Les Ombellifères, Perpignan: 52 (1978).

Type: Sikkim: Momay Samdong (Lachung), 5000m, 18 ix 1982, *G.A. Gammie* 916 (holo. CAL).

In his original extremely brief diagnosis Mukherjee gave only a one line description and cited the holotype. In his joint work with Constance (Mukherjee & Constance, 1993) this description was amplified, but it was stated that this species was still known only from the type collection. During investigations for the *Flora of Bhutan*, it has come to light that there are three specimens in the Edinburgh herbarium (E) that were determined by Mukherjee as *Acronema pseudotenerum* in July 1986 (in Samoens, France, whilst on loan to Farille), but not included in Mukherjee & Constance (1993). These specimens are:

- a) S Tibet: Chosan, Tsari, 15,000ft, 14 viii 1936, *Ludlow & Sheriff* 2043, (BM, E)
- b) Tibet: Tsari, 13,000–14,000ft, 11 ix 1935, *Kingdon Ward* 12325, (BM, E)
- c) SE Tibet: Kongbo Province, Tsari Sama, Langong, 28°45'N 94°00'E, 11,500–12,500ft, 13 vi 1938, *Ludlow, Sheriff & Taylor* 5547, (BM, E)

These not only extend the range of the species into Tibet, but also provide petal characters not given in Mukherjee & Constance (1993). The petals of the above specimens are white to suffused purple, narrowly elliptic to lanceolate, acuminate at the apex, shortly clawed at the base, 1.3–2.7 × 0.5mm. Furthermore, the rootstock appears to be a slender (mat-forming?) horizontal rhizome, to 30 × 2mm.

Acronema tenerum (DC.) Edgew., in Trans. Linn. Soc. London 20: 51 (1846).

Syn.: *Sison tenerum* Wall., Numer. List. 593 (1829) *nomen nudum*. *Helosciadium tenerum* DC., Prodr. 4: 105 (1830). *Pimpinella tenera* (DC.) C.B. Clarke, Fl. Brit. India 2: 686 (1879). *Carum tenerum* (DC.) Franch. in Bull. Soc. Philom. Paris VIII. 6: 122 (1894). Type: Nepal: *Sison?* *tener* Wall., Mons. Alto Sheopore Napalae, ix 1821, *Wallich* [Wall. Cat. 593] (lecto. selected here G-DC n.v. [IDC fiche, sheet 599]; isolecto. K, K-W, LIV).

Pimpinella tenera var. *dissecta* C.B. Clarke, Fl. Brit. India 2: 686 (1879). *Acronema tenerum* var. *dissectum* (C.B. Clarke) H. Wolff, Pflanzenr. 90 Heft. (4.228): 321 (1927). Type: based on same collection as the typical variety 'with type', presumably K-W specimen.

This is the type of the genus *Acronema* Edgew. Literature records of *A. muscicolum* (Hand.-Mazz.) Hand.-Mazz. from Bhutan have proved to be based on misidentifications of this *A. tenerum*.

Angelica L.

Angelica nubigena (C.B. Clarke) P.K. Mukh. in Bull. Bot. Surv. India 24(1–4): 42 (1982).

Syn.: *Heracleum nubigenum* C.B. Clarke, Fl. Brit. India 2: 713 (1879). Type: Sikkim: *Heracl. diversifolium*, Regio temp. Chola [Cho La], 11,000ft, 6 xi 1849, J.D. Hooker (lecto. selected here K; isolectos CAL n.v., K).

Constance annotated the above Kew specimen as the holotype in 1978, and it is hereby formally designated as the lectotype.

Angelica sikkimensis (C.B. Clarke) P.K. Mukh. in Bull. Bot. Surv. India 24(1–4): 43 (1982).

Syn.: *Peucedanum sikkimense* C.B. Clarke, Fl. Brit. India 2: 710 (1879). Type: Sikkim: Rishee [Rishi] 5000ft, 5 x 1875, C.B. Clarke 24997a (lecto. selected here K; isolectos CAL n.v., K).

Chamaesciadum C.A. Meyer

Chamaesciadum subnudum (H. Wolff) C. Norman in J. Bot. 76: 233 (1938).

Syn.: *Trachydium subnudum* H. Wolff in Repert. Spec. Nov. Regni Veg. Beih. 27: 125 (1929). Type: Chumbi Valley: Kambajong [Tawa Dzong], ix 1903, D. Prain (lecto. selected here K; isolecto. E).

Trachydium verrucosum R.H. Shan & F.T. Pu, Fl. Reip. Popul. Sinicae, 55(1): 299 (1979). Type: China, Xizang, Lhasa, Nai-go-ma Shan, 5000m, 18 viii 1965, Y.T. Chang & K.Y. Lan 1885 (holo n.v. [herbarium not cited]).

Trachydium lamondianum Farille & Malla in Candollea 40: 533 (1985). Type: Chumbi Valley: Phari, 14,000ft, 12 ix 1912, Rohmoo Lepcha 252 (holo. E).

Of the two syntype elements cited by Wolff for *T. subnudum*, that chosen as lectotype bears C.B. Clarke's manuscript name which Wolff published, and the collection is represented in at least two herbaria.

This taxon has in the past been poorly understood as fruiting material is scarce. Flowering and immature fruiting material has been superfluously described within *Trachydium* (*T. verrucosum*, *T. lamondianum*) on gross morphology, even though the radiant petals and hispid hairs are uncharacteristic of the genus. Norman (1938) had good mature fruiting material available to him, and as part of his rationalization of *Trachydium* transferred the taxon into *Chamaesciadum*. This species is still rather

poorly known, and further work is required on this and other squat, high-altitude Sino-Himalayan umbellifers.

Chamaesium H. Wolff

Chamaesium viridiflorum (Franch.) H. Wolff ex R.H. Shan in *Sinensis* 8: 87 (1937).

Syn.: *Trachydium viridiflorum* Franch. in *Bull. Soc. Philom. Paris* VIII 6: 111 (1894).

Chamaesium viridiflorum (Franch.) C. Norman in *J. Bot.* 76: 231 (1938) *comb. superfl.*

Type: China: Yunnan, Maeulchan, 11,500ft, 10 ix 1889, *Delavay* 3900 (lecto. selected by Mukherjee & Constance, *Umbel. of India* 33 (1993), P).

Trachydium affine W.W. Sm. in *Rec. Bot. Surv. India* 4: 374 (1913). Of the two syntype elements cited by Smith the following is chosen as the material is in better condition and there is a duplicate at K. Type: Sikkim: Sikkim Himalaya, Ningbil, [Chola range] 13,500ft, 5 viii 1910, *W.W. Smith* 4115 (lecto. selected here E; isolecto. K).

Chamaesium novem-jugum (C.B. Clarke) C. Norman in *J. Bot.* 76: 231 (1938).

Syn.: *Trachydium novem-jugum* C.B. Clarke, *Fl. Brit. India* 2: 672 (1879). Type:

Sikkim: *Trachydium sp.5*, Regio Alp, Lama Kangra [Kongra La], 14,000ft, 24 vii 1849, *J.D. Hooker* (lecto. selected here K).

Cnidium Cusson

Cnidium bhutanicum M.F. Watson, *nom. nov.*

Basionym: *Cnidium atropurpureum* M.F. Watson in *Edinb. J. Bot.* 53: 128 (1996), non Spreng. in *J.J. Roemer & J.A. Schultes, Syst.* 4: 418 (1820). Type: Bhutan: Thimphu District, Talukah [Tataka] Gompa, 3700m, 28 viii 1988, *J.R.I. Wood* 6609 (holo. E.).

Heracleum L.

Heracleum candicans Wall. ex DC., *Prodr.* 4: 192 (1830).

Syn.: *Heracleum candicans* Wall., *Numer. List.* 573 (1829) *nomen nudum.*

Tetrataenium candicans (Wall. ex DC.) Manden. in *Zametki Sist. Geogr. Rast.* 41: 44 (1986). Type: India: Kumaon, *Robert Blinkworth* [Wall. Cat. 573.2] (lecto. selected here G-DC n.v. [IDC fiche, sheet 635]; isolecto. K-W).

This and *Heracleum obtusifolium* Wall. ex DC. form a complex group requiring further study and elucidation across the whole Sino-Himalayan region. The former tends to have more rounded leaflets with crenate margins, the latter acute leaflets with serrate-dentate margin.

***Heracleum nepalense* D. Don, Prodr. Fl. Nepal: 185 (1825).**

Syn.: *Tetrataenium nepalense* (D. Don) Manden. in Trudy Tbilissk. Bot. Inst. 20: 17 (1959). Type: Nepal: Mont. alt. Napalia, 1821, *Wallich* [Wall. Cat. 576] (lecto. selected here BM [on sheet with *Schlagintweit* 4892]; isolectos CAL n.v., E, K, K-W).

The type collections appear somewhat heterogeneous, but in fact all represent the same species. This complex species is often poorly collected on account of the plant's sheer size. The characteristic main terminal umbels are often not collected in favour of the smaller 'plant-press size' umbels on side branches!

***Heracleum obtusifolium* Wall. ex DC., Prodr. 4: 191 (1830).**

Syn.: *Heracleum obtusifolium* Wall., Numer. List. 577 (1829) *nomen nudum*. *Tetrataenium obtusifolium* (Wall. ex DC.) Manden. in Zametki Sist. Geogr. Rast. 42: 13 (1991). Type: Nepal: *Heracleum obtusifolium*, Napalia, 1821, *Wallich* [Wall. Cat. 577] (lecto. selected here G-DC n.v. [IDC fiche, sheet 634]; isolecto. K-W).

See notes under *Heracleum candicans*.

***Heracleum sublineare* C.B. Clarke, Fl. Brit. India 2: 713 (1879).**

Syn.: *Tetrataenium sublineare* (C.B. Clarke) Manden. ex Farille, Cauwet & S.B. Malla in Candollea 40: 562 (1985). Type: Sikkim: *Pastinaca* sp.4, unlocalized, 10,000–13,000ft, J.D. Hooker (lecto. selected here K).

Clarke cites the type details as '*Pastinaca* sp.4, Sikkim, 10,000–13,000ft, J.D. Hooker, Herb. Ind. Or. Hook. fil & Thomson'. There are three sheets at K, which are referable to this description: one bearing collections from Lachen and Lachoong [Lachung]; another bearing collections from Tungu [Thanggu] and Yeumtong [Yumthang]; and the third with unlocalized Sikkimese plants. It is thus difficult to ascribe precise localities to any of the plants, and as the third sheet has the best material I have chosen it as the lectotype.

***Heracleum wallichii* DC., Prodr. 4: 195 (1830).**

Syn.: *Heracleum diversifolium* Wall. p.p., Numer. List 574 (1829) *nomen nudum*. *Tetrataenium wallichii* (DC.) Manden. in Zametki Sist. Geogr. Rast. 41: 47 (1986). Type: Nepal: *Heracleum diversifolium*, Mont. alt. Napalia, ix 1821, *Wallich* [Wall. Cat. 574.1] (lecto. selected here G-DC n.v. [IDC fiche, sheet 636]; isolectos BM? [un-numbered], E, K-W).

Under the Wallich catalogue number 574 there are two gatherings, one (574.1) from the wild in Nepal, and the other (574.2) from the Calcutta Botanic Garden grown from seed from Nepal. Study of the collections in the Wallich Herbarium (K-W) reveal that the specimen from cultivated material (574.2) is not a *Heracleum* but in fact an immature hairy-fruited *Pimpinella diversifolia* (see notes under *Pimpinella*).

Lalldhwojia Farille

Lalldhwojia staintonii Farille in Rev. Gen. Bot. 91: 28 (1984). Type: Nepal: Versant nord de Lamjung, 3800–4000m, 24 ix 1981, M.A. Farille 81–565 (holo. KATH, n.v.; iso. BM, E, G n.v., P n.v.).

Syn.: *L. cooperi* Farille in Rev. Gen. Bot. 91: 31 (1984). Type: Sikkim: Bharang, border with Bhutan, 1 ix 1913, R.E. Cooper 772 (holo. E).

Peucedanum acronemifolium H. Wolff, Repert. Spec. Nov. Regni Veg. Beih. 33: 386 (1933). Type: Sikkim: Changu, 12,500ft, 13 viii 1910, W.W. Smith 4287 (lecto. selected here K.).

Farille (1984) erected the genus *Lalldhwojia* describing *L. staintonii* Farille (the type species) from two gatherings, together with the smaller *L. cooperi* Farille from a single collection. On examining further, recent and historic, collections from Bhutan and Sikkim it is apparent that the latter is merely based on a depauperate gathering and does not merit taxonomic recognition. *Lalldhwojia* is thus considered to be a monotypic genus with *L. staintonii* (syn. *L. cooperi*) as the only species.

Oenanthe L.

Oenanthe hookeri C.B. Clarke, Fl. Brit. India 2: 697 (1879).

Type: India: 1. *Oenanthe*, Khasia, Regio Temp., 5–6000ft, J.D. Hooker & T. Thomson s.n. (lecto. selected here K.).

Oenanthe thomsonii C.B. Clarke, Fl. Brit. India 2: 697 (1879).

Type: India: 2. *Dasyloma*, Khasia, Churra, Regio Temp., 5–6000ft, 12 vi 1850, J.D. Hooker & T. Thomson 585 (lecto. selected here K.).

Physospermopsis H. Wolff

Physospermopsis kingdon-wardii (H. Wolff) C. Norman in J. Bot. 76: 231 (1938).

Syn.: *Trachydium kingdon-wardii* H. Wolff in Repert. Spec. Nov. Regni Veg. Beih. 27: 124 (1929). *Pleurospermum kingdon-wardii* (H. Wolff) M. Hiroe, Umbelliferae of World 747 (1979). Type: China: Plants of NW Yunnan and E Tibet, *Trachydium* sp., Atuntsi [Dechin], 14,500ft, 7 viii 1913, F. Kingdon Ward 992 (lecto. selected here E).

Only the above collection was cited in the protologue, and as the specimen in Edinburgh bears a determination by Wolff (30 v 1928) it is chosen as the lectotype.

Physospermopsis obtusiuscula (DC.) C. Norman in J. Bot. 76: 231 (1938).

Syn.: *Ligusticum obtusiusculum* Wall., Numer. List 543 (1839) *nomen nudum*. *Hymenolaena obtusiuscula* DC., Prodr. 4: 246 (1830). *Trachydium obtusiusculum*

(DC.) C.B. Clarke, Fl. Brit. India 2: 673 (1879). *Pleurospermum obtusiusculum* (DC.) M. Hiroe, Umbelliferae of World 741 (1979). Type: Nepal: *Ligusticum obtusiusculum* Wall. Gossain Than, 1821 *Wallich* [Wall. Cat. 543] (lecto. selected here G-DC [specimen bearing full label] n.v. [IDC fiche, sheet 654]; isolectos G-DC n.v., K-W, K).

Trachydium obtusiusculum (DC.) C.B. Clarke var. *strictum* C.B. Clarke, Fl. Brit. India 2: 673 (1879). Type: Sikkim: *Trachydium* sp. 6, Sikkim, Chola, Regio temp, 10–12,000ft, 6 xi 1849, J.D. Hooker (lecto. selected here K [specimen bearing Clarke's drawing of the fruit cross-section]).

Trachydium hirsutulum C.B. Clarke, Fl. Brit. India 2: 672 (1879). *Physospermopsis hirsutula* (C.B. Clarke) Farille in Candollea 40: 513 (1985). Type: Sikkim: *Trachydium*, Sikkim, Tungu 13–14,000ft, x [1849], Hooker s.n. (holo. K).

Physospermopsis farillei P.K. Mukh. & Constance in Edinb. J. Bot. 48: 41 (1991). Type: Nepal: Lamjung Himal, 4000–4150m, 26 ix 1981, Farille 81–604 (holo. E).

The name *Trachydium hirsutulum* C.B. Clarke (1879: 672) was recombined by Farille (Farille *et al.*, 1985: 513) into *Physospermopsis hirsutula* (C.B. Clarke) Farille. However, it has been seen to be problematic in the literature and requires some elucidation. Norman (1938: 231) correctly identified the type collection used by Clarke (*Trachydium*, Sikkim, Tungu 13–14,000ft, x [1849], Hooker s.n., K) as a mixed gathering of a *Physospermopsis* late in fruit and sterile *Potentilla coriandri-folia* D. Don. It is unfortunate that the specific epithet is attributable to the hairiness of the latter, and not in fact to the glabrous umbellifer that Clarke was naming. Norman also suggested that the plants of the '*Trachydium*' present on the sheet (one of which was removed for loan to H. Wolff on 20th July 1920) are only '... burnt-up and stunted specimens of *Trachydium* [= *Physospermopsis*] *obtusiuscula*'. When Farille recombined Clarke's name under *Physospermopsis*, he commented that Clarke's type was insufficient to display the characters now needed, but he failed to designate another type (e.g. epitype). Mukherjee & Constance (1991: 41) also make this observation, and state that 'the specimens cited by Farille under *P. hirsutula* that we have seen are uniformly glabrous and do, in our opinion, constitute a distinct species ...'. They go on to publish the name *P. farillei* for these glabrous plants. I agree with Norman's conclusions on the Clarke type, and thankfully the above misleading and unnecessary names can be placed into synonymy.

Pimpinella L.

***Pimpinella diversifolia* DC.**, Prodr. 4: 122 (1830).

Syn.: *Heracleum diversifolium* Wall. p.p., Numer. List 574 (1829) *nomen nudum*. Type: Nepal: Calcutta Botanic Garden, introduced from Nepal, *Wallich* [Wall. Cat. no 574.2] (lecto. selected here G-DC n.v. [IDC fiche, sheet 606]; isolecto. K-W).

When describing this species De Candolle linked his name with Wallich's collections

saying 'In Sirmore Indiae orientalis *Heracleum? diversifolium* Wall mss'. Nasir (1972: 64) recorded Wallich 565 (K) as the type, however, this number refers to *Pimpinella trifoliata* in the Wallich Catalogue and was used by Clarke as the type for his *Pimpinella diversifolia* var. *alpina* (see below under *P. tongloensis*). The Wallich herbarium (K-W) has two collections under '*Heracleum? diversifoliumHeracleum* from Nepal (see notes above under *Heracleum wallichii*), and 574.2 is indeed a *Pimpinella*, collected from the Calcutta Botanic Garden grown from seed introduced from Nepal. The De Candolle herbarium (G-DC) contains 2 sheets under his *Pimpinella diversifolia*; one labelled as from the Calcutta Botanic Garden (introduction) and Sirmore, the second has no provenance. The first specimen is most probably referable to Wall. Cat. 574.2, and is hereby chosen as the lectotype. Mukherjee & Constance (1983: 153) implicitly concur with this conclusion as they cited the type as Wallich 574B (without herbarium location).

***Pimpinella sikkimensis* C.B. Clarke, Fl. Brit. India 2: 685 (1879).**

Type: Darjeeling: Sikkim, Rungbee [Rimbi Chhu], 6000ft, 23 ix 1875, C.B. Clarke 24818c (lecto. selected here BM; isolecto. K).

***Pimpinella tongloensis* P.K. Mukh. in Bull. Bot. Surv. India 12: 78 (1970).**

Type: Sikkim [unlocalized], Kurz s.n. (holo. CAL, n.v.).

Syn.: *Pimpinella diversifolia* DC. var. *alpina* C.B. Clarke, Fl. Brit. India 2: 688 (1879).

Type: Nepal: *Pimpinella trifoliata* Wall., M. Altissimae Napaliae, 1821, Wallich [Wall. Cat. 565] (lecto. selected here K-W [Sheet B]; isolectos BM, E, K).

When Clarke described *Pimpinella diversifolia* DC. var. *alpina* he cited Wall. Cat. 565 as the type. However, there are four specimens of this number at Kew (where Clarke worked): two in the Wallich herbarium (K-W, then housed nearby in the Linnean Society), and two in the general collection. The sheets in the Wallich herbarium (unannotated by Clarke) are clearly gatherings of two different plants under the same number: sheet A, *via ad Goso-than, Julio 1821 fl.*, has dark green leaves, obovate, notched petals and papillose fruits; whereas sheet B has paler leaves, narrowly ovate, acute petals and glabrous fruits. The other two duplicates (K) are annotated by Clarke as *Pimpinella diversifolia* (not to variety), and likewise represent mixed gatherings. The glabrous fruited material best fits Clarke's original description and thus the above typification is made.

The once poorly known var. *alpina* is now better understood and considered to be a good species, attributable to *P. tongloensis* P.K. Mukh. It differs from *P. diversifolia* in having acute radiant petals (without incurved apex), nearly all leaves trifoliate, leaflets glabrous excepting the main veins, and glabrous attenuate fruits. The papillose fruited plant in the mixed gathering Wall. Cat. 565 has since been found to match with *P. urceolata* Watt ex M.L. Banerji emend. P.K. Mukh. (1970).

Pimpinella wallichii C.B. Clarke, Fl. Brit. India 2: 685 (1879)

Type: Nepal: Napalia, 1830, *Wallich s.n.* (lecto. selected here K, specimen bearing Clarke's annotations).

Schulzia C.P.J. Sprengel

Schulzia dissecta (C.B. Clarke) C. Norman in J. Bot. 76: 231 (1938).

Syn.: *Trachydium dissectum* C.B. Clarke, Fl. Brit. India 2: 672 (1879). Type: Sikkim: 3. *Cortia*, Tungu [Thanggu] 13–16,000ft, Regio Alp., x [1849], *J.D. Hooker* (lecto. selected here K).

Selinum L.

Selinum candollei DC., Prodr. 4: 165 (1830).

Syn.: *Angelica candollei* Wall., Numer. List 582 (1829) *nomen nudum*. *Cortia candollei* (DC.) Leute in Ann. Naturhist. Mus. Wien 73: 83 (1969). '*Oreocome candolleana* (DC.) Edgew.' not validly published (see below) in Trans. Linn. Soc. London 20: 55 (1851). Type: Nepal: *Angelica?* *candollei*, Montes Alt. Nepaliae, 1821, *Wallich* [Wall. Cat. 582.1] (lecto. selected here G-DC, n.v. [IDC fiche, sheet 624]; isolectos E, K-W, K).

Nasir (1972: 119) cites the K-W specimen as the type of *Seenum candollei*. This is not selected here as the lectotype as De Candolle would not have based his species name on it when writing his original description.

Selinum is a complex genus where there are generic level problems at the boundaries with *Ligusticum* and *Cortia*, and large ranges in morphological variation have clouded specific limits. Recent collections from Bhutan have helped to resolve the situation for two of the taxa (*S. candollei* and *S. wallichianum* (DC.) Raizada & Saxena), but there remains a nomenclatural problem of what are the correct names to apply. The first species (*S. candollei*) is a robust plant characterized by having stout (>6mm thick at base) essentially glabrous stems, fine ultimate leaf segments (<0.6mm wide), narrow linear-lanceolate bracteoles (<0.75mm broad) often forked or occasionally pinnatifid, and the dorsal ribs of the fruits distinctly winged, wings almost as wide as the laterals (the most reliable of the characters). The second species (*S. wallichianum*) is a more slender plant with densely puberulent stems (<6mm thick at base), usually more coarsely divided leaves with broader ultimate leaf segments (>0.7mm – in E Himalayan material), lanceolate (rarely divided) early falling bracts and bracteoles (usually >1mm broad), and dorsal ribs of the fruits prominent but not winged (occasionally abortive wings at base). In Bhutan the former species is typically found in moist clearings and river gorges, whereas the latter is usually found in more open, well-drained situations. The nomenclature of these two species has been compounded by the mixture of species in the Wallich type collections (including De Candolle's set and the Wallich top set), and a long history of misapplication of the early names.

The history of these names begins with De Candolle publishing *Selinum candollei* DC. (1830: 165), and *Peucedanum wallichianum* DC. (1830: 181). Five years later Lindley published *Pleurospermum cicutarium* Lindl. (in Royle 1835: 233) based on Royle collections from Choor and Simla. Edgeworth when describing unpublished plants from North Western India made comments on the above species which have since been misinterpreted in the literature. Firstly he said that his new species, *Oreocome filicifolia*, is very similar to *Selinum candollei* and *Pleurospermum cicutarium*; listing *Peucedanum wallichianum* DC. in parentheses after *S. candollei*. This has been read by some authors to mean that Edgeworth is proposing a *nomen novum* for De Candolle's name creating the illegitimate name *S. candollei* Edgew. non DC. which is both superfluous and a later homonym. Edgeworth would surely have been aware of De Candolle's earlier homonym, and in fact was not intending to introduce a new name but rather to point out that in his opinion the two De Candolle names are synonymous. A few lines down in the same article Edgeworth refers to '*O. Candolliano*' which later botanists have taken to be a new combination in *Oreocome* based on *Selinum candollei* DC. Given that Edgeworth refers to *Selinum candollei* previously with no mention of a transfer into *Oreocome* it is more than likely that the '*O. Candolliano*' reference is merely a typographic error for '*S. Candolliano*' and therefore should not be considered a new combination. Thus the names *Selinum candollei* Edgew. non DC. and *Oreocome candolleana* (DC.) Edgew. should be regarded as invalid as they were not accepted by the author in the original publication.

***Selinum dissectum* (DC.) C.B. Clarke, Fl. Brit. India 2: 701 (1879).**

Syn.: *Selinum dissectum* Wall., Numer. List 581 (1829) *nomen nudum*. *Peucedanum dissectum* DC., Prodr. 4: 178 (1830). Type: Nepal: Emodi Napalensis, Gossain Than, [27 x 1821], Wallich [Wall. Cat. 581] (lecto. selected here G-DC, excluding fruiting umbellule on label, n.v. [IDC fiche, sheet 629]; isolecto. K-W).

Clarke recombined Candolle's *Peucedanum dissectum* under *Selinum dissectum* (DC.) C.B. Clarke, but only included it as a doubtful species. Candolle's name is based on the Wallich collection '*Selinum dissectum*, Emodi Napalensis, Gossain Than' (Wall. Cat. 581). Clarke mentioned that the sheet in the Wallich herbarium (K-W) is made up of three elements:

- i) a good flowering specimen (bracts 4–8, bracteoles prominent)
- ii) a young flowering specimen, ebracteate
- iii) a detached umbel in fruit

Clarke says the De Candolle description appears to be from (ii) and (iii) excluding (i); (i) and (ii) are certainly different species, and (iii) possibly belongs to neither. From my own examination of the K-W sheet: (i) is probably *Selinum striatum*; (ii) has obsolete calyx teeth and is not a *Selinum* (possibly a *Ligusticum*); and (iii) is also not a *Selinum*. From the microfiche the specimen at G-DC appears to be element

(ii) with a fruiting ray and umbellule of element (iii). Mukherjee and Constance (1993: 183) state that the specimen at CAL is also a mixture, and suggest abandoning the specific epithet as a source of continuing confusion. Unfortunately the type material in the De Candolle herbarium is too immature for reliable identification, and the name remains *non satis cognita*.

Selinum striatum (DC.) C.B. Clarke, Fl. Brit. India 2: 699 (1879).

Syn.: *Laserpitium striatum* Wall., Numer. List 583 (1829) *nomen nudum*. *Ligusticum striatum* DC., Prod. 4: 158 (1830). ‘*Selinum striatum* (DC.) Benth., was not validly published in Benth. & Hook.f. Gen. Pl. 1: 914 (1867)’. *Cortia striata* (Wall. ex DC.) Leute in Ann. Naturhist. Mus. Wien 73: 85 (1969). Type: Nepal: *Laserpitium striatum*, Nepalia, Legi ad agros Oryzaceos convallis Nepaliae magnae, 1821, Wallich [Wall. Cat. 583] (lecto. selected here G-DC n.v. [IDC fiche, sheet 621]; isolectos BM, E, K-W, K).

In his species diagnosis of *Ligusticum striatum*, De Candolle (1830: 158) describes the mericarp furrows as multivittate [hence including it in *Ligusticum*], and the leaves as 2-pinnatisect with lobes entire, acute, rarely incised. Bentham (1867: 914) observed the material in the Wallich herbarium to have furrows with solitary vittae, and implied that the species should be referred to the genus *Selinum* (but without validly publishing a new combination). Clarke (1879: 699–700) said that Bentham put this inconsistency down to a mistake on the part of De Candolle, but as the description of the leaf dissection also did not tally with the specimens in Wallich herbarium, he concluded that De Candolle’s specimen is something entirely different (and Wallich distributed two plants mixed under the same number).

On examination of the microfiche edition of the De Candolle herbarium it is apparent that the specimen in his herbarium matches well with those at BM, E, K-W, and K, and that De Candolle’s description of the leaves in his *Prodromus* disagrees with his material. However, it is the type material that carries the name, and thus the above lectotypification is made, and Clarke’s name is treated as a recombination of De Candolle’s basionym (Clarke states that his species concept is ‘*non Ligusticum striatum* DC.’, but they use the same type collection).

The distribution of this species is poorly known; it apparently occurs in Nepal and Khasia, but as yet has not been reliably recorded from Bhutan. It is interesting to note that one of the specimens in K-W shows the dimorphic nature of the leaves: the basal leaves are much less finely divided than the stem leaves.

Selinum wallichianum (DC.) Raizada & Saxena, in Indian Forester 92: 323 (1966).

Syn.: *Peucedanum wallichianum* DC., Prod. 4: 181 (1830). *Cortia wallichiana* (DC.) Leute in Ann. Naturhist. Mus. Wien 73: 83 (1969). Type: India: *Selinum tenuifolium*, Emodus ad Gossain Than, Wallich [Wall. Cat 579] (lecto. selected here G-DC n.v. [good fruiting specimen on IDC fiche, sheet 630]). *Selinum tenuifolium* Wall., Numer. List 579 p.p.(1829) *nomen nudum*. *Selinum tenuifolium* C.B. Clarke, Fl. Brit. India

2: 700 (1879), illegitimate when published. *Pleurospermum cicutarium* Lindl., in *Royle, Ill. bot. Himal. Mts.*: 233 (1835). '*Selinum cicutarium* (Lindl.) Benth., not validly published in Benth. & Hook. f., Gen. Pl. 1: 914 (1867)'. Type: India, Choor and Simla, *Royle s.n.* (lecto. selected here LIV [sheet bearing original label]; isolecto. LIV).

The problem of which name to apply to this wide spread species is partly due to the heterogeneity of the Wallich collections numbered 579, on which De Candolle based his species, and also to a long history of misapplied names. The Wallich herbarium (K-W) has four specimens under this number which represent a mixture of *S. candolleani* and *S. wallichianum*. De Candolle's herbarium (G-DC) has three specimens sent by Wallich and they also are a mixture of these two species. De Candolle's diagnosis for *Peucedanum wallichianum* covers all the specimens and hence includes the phrase 'involucri utriusque foliolis incisis', i.e. both bracts and bracteoles incised. This is characteristic of *Selinum candolleani*, and indeed Cannon (1979: 189) included *Peucedanum wallichianum* DC. in the synonymy of *S. candolleani* and upheld the illegitimate name *S. tenuifolium* C.B. Clarke for this species. To maintain the current widespread usage of the name *S. wallichianum*, and to avoid the nomenclatural problems of conserving Clarke's illegitimate name, I have selected the good fruiting specimen from 'Emodus as Gossain Than' in the De Candolle herbarium as the lectotype of *P. wallichianum*. Unfortunately, in this case it has not been possible to equate the phenology and label details with the specimens in the Wallich herbarium, and hence no isolectotypes have been designated.

The complex range of variation within this group still awaits critical morphological examination across the whole of the Himalayas from Pakistan to China, for although there are some distinctive taxa their taxonomy is still open to speculation.

Sinocarum H. Wolff Ex R.H. Shan & F.T. Pu

Sinocarum and its near relatives *Acronema* and *Tongoloa* have been much confused in the literature and herbaria (see notes under *Acronema*). The problems are particularly compounded in this genus as there is a plethora of Farille and Mukherjee & Farille unpublished names appearing on determination slips in British herbaria. Farille has obviously done much work on this generic complex, but to date this remains unpublished. I do not agree with many of his annotations, although some of the taxa that he recognizes are good and need publishing. The names that Farille coined are often rather long and convoluted, and not always legible. Furthermore, they do not always match the species delimitations that I wish to recognize, so to avoid confusion I am not taking up these names. Although during the preparation of this account I have been able to clarify some of the problems that existed in the group, further work across the whole Sino-Himalayan region is needed to get an accurate assessment of the specific limits in this complex genus. The following key is extracted from the unpublished *Flora of Bhutan* account.

Key to Bhutanese species of Sinocarum

- 1a. Plants small <6cm tall; rhizome cylindric with a thickened tap-root; petiole bases broadly sheathing _____ 2
- 1b. Plants usually >3cm tall, or the combination of rhizome and petioles sheaths not as above _____ 3
- 2a. Plants very small, <3cm high; rays <2cm long _____ **S. minus** M.F. Watson
- 2b. Plants usually >3cm high; rays >2cm long _____ **S. woodii** M.F. Watson
- 3a. Stems much-branched at base forming clumps; calyx teeth minute triangular _____ **S. longii** M.F. Watson
- 3b. Stems solitary or sparsely branched at base; calyx teeth obsolete _____ 4
- 4a. Stems stout, 2–7mm thick; fruiting heads bent horizontally _____ **S. clarkeanum** P.K. Mukh. & Constance
- 4b. Stems slender, usually <3mm thick; fruiting heads erect _____ 5
- 5a. Umbels 3–4-rayed; umbellules 3–5-flowered; bracteoles absent _____ **S. pauciradiatum** R.H. Shan & F.T. Pu
- 5b. Umbels >5-rayed; umbellules >6-flowered; bracteoles usually present (often falling early) _____ 6
- 6a. Leaf sheaths very broad, >8mm wide; umbellules usually <10-flowered; fruits sub-globose _____ **S. pulchellum** C. Norman ex M.F. Watson
- 6b. Leaf sheaths narrower, <8mm wide; umbellules usually >10-flowered; fruits ovoid to oblong _____ 7
- 7a. Rootstock an ovoid tuber with fibrous roots; leaves with segments >0.5mm broad and sheaths tapering at the apex; fruits ovoid _____ **S. sikkimense** (P.K. Mukh.) P.K. Mukh. & Constance
- 7b. Rootstock a short rhizome, usually with a main thickened root; leaf segments <0.5mm broad and sheaths usually rather auriculate at apex; fruit oblong-ovoid _____ **S. wolffianum** (Fedde) P.K. Mukh. & Constance

Sinocarum coloratum (Diels) H. Wolff ex R.H. Shan & F.T. Pu., Fl. Reipub. Pop. Sinicae, 55(2): 33 (1985).

Syn.: *Carum coloratum* Diels in Notes RBG Edinb. 5: 287 (1912). Type: China: NW Yunnan, cliffs on eastern flank of the Lichiang Range, 11–12,000ft, Lat. 27°25'N, ix 1906, G. Forrest 3060 (lecto. selected here E; isolecto. BM).

Sinocarum wolffianum (Fedde) P.K. Mukh. & Constance, Edinb. J. Bot. 48: 42 (1991).

Syn.: *Acronema wolffianum* Fedde in Repert. Spec. Nov. Regni Veg. Beih. 27: 328 (1930). Type: Sikkim: Jongri [Dzongri], 12,000ft, 15 x 1875, C.B. Clarke 25,796 (lecto. selected here K). *Pimpinella feddeana* M. Hiroe, Umbelliferae of World: 832 (1979). *Novem novum*, based on same type as *A. wolffianum*.

Tordyliopsis DC.

Tordyliopsis brunonis DC., Prodr. 4: 199 (1830).

Syn.: *Tordylium brunonis* Wall., Numer. List 590 (1829) *nomen nudum*. *Heracleum brunonis* (DC.) C.B. Clarke, Fl. Brit. India 2: 713 (1879). Type: India-Nepal: Kumaon Nepaliae versus Emmodum, *Robert Blinkworth* [Wall. Cat. 590] (lecto. selected here G-DC *n.v.* [IDC fiche, sheet 637]; isolectos BM, CAL *n.v.*, E, K, K-W).

Vicatia DC.

Vicatia coniifolia DC., Prodr. 4: 243 (1830).

Syn.: *Sison coniifolium* Wall., Numer. List 591 (1828) *nomen nudum*. *Sphallerocarpus coniifolius* (DC.) Koso-Pol. in Byull. Moskovsk. Obshch. Isp. Prir., Otd. Biol. 29: 202 (1916). Type: India: *Sison? coniifolium* Wall., Kamoon [Kumaon], *Wallich* [Wall. Cat. 591.2], (lecto. selected here G-DC *n.v.* [IDC fiche, sheet 653]; isolecto. K-W).

Although this species has often been recorded from Bhutan, most of the specimens have proved to be misidentified *Meeboldia digitata*. The genera are distinguished (in Bhutan) by *Vicatia* having white flowers and obsolete calyx teeth compared to the yellow flowers and lanceolate calyx teeth of *Meeboldia*. Furthermore, *V. coniifolia* has distinctive short male flowers in the centre of each umbellule and on very short pedicels in the centre of the umbel. These become very obvious as the other pedicels elongate in fruit.

ACKNOWLEDGMENTS

The author would like to express his thanks to the Directors and Staff of the Herbaria cited in the text who allowed access to specimens and loaned material, to Brian Coppins, Dan Nicholson and an anonymous reviewer for their invaluable advice and suggestions on nomenclatural matters, and to Erica Schwarz for her careful editing.

APPENDIX OF VOUCHESED SPECIMENS

The following is a complete listing of the specimens collected within the geographic boundaries of the *Flora of Bhutan* (Bhutan, Chumbi Valley (Tibet), Sikkim and Darjeeling district of India) that were consulted for the preparation of the *Umbelliferae* account. Duplicates of many of these are housed in other herbaria, and it is hoped that this list will be useful in updating determinations of these, and for the interpretation of the *Flora of Bhutan* account against past literature (specimens are not listed in the *Flora of Bhutan* account). Herbaria included in square brackets indicate specimens only seen from photographs or listed in a secondary source.
